Germany (Xetra) - WARN

- Governance: {'REVIEW': 25}; peer-scan state: {'scan_cache_stale': 25}; distress: {'ELEVATED_RISK': 7, 'INSUFFICIENT_DATA': 17, 'NOT_APPLICABLE': 1}
- Tested at: 2026-10-16T01:36:45.696835+00:00 .. 2026-10-16T01:36:54.968496+00:00
- Missing prices: none; missing ISIN: 0; degraded providers: 0
- BUY_CANDIDATE: none; fail-closed BUY (benchmark unavailable): none
- Finding: peer benchmark not fresh for 25/25 (scan cache stale: BUY impossible, fail-closed)

Recommendations

1. Germany: peer benchmark is stale for all 25 names (scan cache from 2026-09-29), so no BUY can be produced - correct fail-closed behaviour, but valuation comparison is unavailable. Refresh the XETRA scan cache in a controlled, approved run.
2. Italy: A2A (fundamental_source: official source unavailable), MB and REC (fundamental_core_figures missing) are BLOCK. Keep blocked until official filings are ingested.
3. Norway: 10/25 BUY_CANDIDATE is high. All have a same-sector benchmark (n=4..12) and P/E far below it; review small peer groups (n=4: YAR) before trusting. MEDI was correctly fail-closed (no sector benchmark).
4. USA: ISIN is absent for all sampled names (SEC-sourced identity); not decision-affecting.
5. Prices are 1-3 days old in this run; do not present as live quotes.

Decision-stability evidence

- 8 regression tests (analysis/tests/test_global_decision_stability.py): missing/stale/expired cache never yields BUY; fresh-to-stale never flips NO_RECOMMENDATION to BUY; contradiction preserved while fresh; legitimate discount BUY still allowed; identical evidence gives identical decisions (5 repeated runs).
- Full backend suite on PR tip: 1187 passed.
- Live example: Norway MEDI (P/E 32.1, no sector benchmark) -> REVIEW / NO_RECOMMENDATION with reason "valuation benchmark unavailable".

Remaining risks

- Sample is top-by-market-cap, not the full exchange; it does not prove full-universe correctness.
- Validated from cached data; live provider outages were not exercised.
- mobile/app.json still has ios.icon pointing at a PNG; newer expo-doctor (1.21.4) rejects it. Fixing it touches mobile/, which on main triggers Expo EAS build and the backend deploy workflow, so it needs an explicit decision.
- The validation data copy (~468 MB) at /home/ubuntu/biap-validation-20261016/data still exists; delete only with approval.
